Genes and Region of sequence similarity are

identified by BLAST

(Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE: Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES:This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation html.

AAS18309 12-MAR-2002 (first entry) AAS18309; AAS18309 standard; DNA; 2517 BP

DNA region of Ketogulonigenium plasmid pADM291 supporting replication.

Cloning vector; Ketogulonigenium replicon; endogenous plasmid; pADM291; transformed host cell; Escherichia coli; plasmid vector replication; ds

Ketogulonigenium sp. strain ADM291-19

WO200177347-A2

18-OCT-2001.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to the isolation of vectors comprising a Ketogulonigenium replicon found on the endogenous plasmid, pADM291. The invention also describes methods of transforming host cells with the vectors and producing polypeptides and/or antisense transcripts by culturing the transformed host cells. The vectors are useful for transforming a host cell by conjugation or electroporation. The vectors which have a replicon functional in both Ketogulonigenium and Escherichia coli, enable the cloning of certain genes of Excogulonigenium in E.coli as the latter is an efficient host for amplification of vector DNA. The present DNA sequence represents the region of Ketogulonigenium endogenous plasmid pADM291 that supports plasmid vector replication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     181

The polynucleotide can be used in a vector. The vector comprises either polynucleotide and a marker gene or (ii) the polynucleotide, a promoter, a transcription terminator and a discrete series of restriction endonuclease recognition sites between the promoter and transcription

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to the isolation of vectors comprising a Ketogulonigenium replicon found on the endogenous plasmid, pADM291. The invention also describes methods of transforming host cells with the vectors and producing polypeptides and/or antisense transcripts by culturing the transformed host cells. The vectors are useful for transforming a host cell by conjugation or electroporation. The vectors which have a replicon functional in both Ketogulonigenium and Escherichia coli, enable the cloning of certain genes of Ketogulonigenium in E.coli as the latter is an efficient host for amplification of vector DNA. The present DNA sequence represents the Ketogulonigenium endogenous plasmid pADM291.
                                                                                                                                                                                                                                                                                                                                                       3015

The present invention relates to the isolation of vectors comprising a Ketogulonigenium replicon found on the endogenous plasmid, pADM291. The invention also describes methods of transforming host cells with the vectors and producing polypeptides and/or antisense transcripts by culturing the transformed host cells. The vectors are useful for transforming a host cell by conjugation or electroporation. The vectors which have a replicon functional in both Ketogulonigenium and Escherichia coli, enable the cloning of certain genes of Ketogulonigenium in E.coli as the latter is an efficient host for amplification of vector DNA. The present DNA sequence represents the replicon of Ketogulonigenium endogenous plasmid pADM291.
                                                                                                                                                                                                                                                                                                       Novel nucleic acid vector comprising Ketogulonigenium replicon found a specific deposited endogenous plasmid, useful for producing polypeptides and/or transcripts by culturing host cells transformed with vector

The present invention relates to the isolation of vectors con a Ketogulonigenium replicon found on the endogenous plasmid, the invention also describes methods of transforming host cet the vectors and producing polypeptides and/or antisense transculturing the transformed host cells. The vectors are useful transforming a host cell by conjugation or electroporation.

                                                                                                                                  1703
                                                                                                                                                                                                                                                                                                                          The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins.

                                                                                                                                                                                                                         The invention relates to isolated polynucleotide (I) and CC polymerside (II) sequences. (I) is useful as hybridisation probes, CC polymerse chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CPR polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC (III). (II) is useful for generating antibodies against it, detecting or CC (III). (II) and its binding partners are useful in medical cal imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. AASA(197-AAS34564 represent novel human CC diagnostic coding sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed CC specification, but was obtained in electronic format directly from WIPO at figure in the printed content of the invention.

                                                                                                                                                                                                                                                                                             The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AlIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   neuroprotective; anti-HIV; anticonvulsant; ophthalmological; antirheumatic; antiarthritic; antidiabetic; antipsoriatic; antinflammatory; cancer; eye disease; arteriosclerosis; anaemia; acute myeloid leukaemia; Alzheimer's disease; AIDS; epilepsy: neurofibromatosis; rheumatoid arthritis; psoriasis; bowel disease;

                                                                                                                                                                      2154
                                                                                                                                                                                                                      2977
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, ADIS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid comprising fragment of chemically modified for diagnosis and treatment of diseases associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI;

The invention relates to novel transgenic organisms useful in the cc production of functional food and drink products for the treatment cc prevention of obesity via the regulation of lipid metabolism. The corganisms comprise a polynucleotide encoding a growth hormone fragment cc enzyme in lipolysis) and inhibiting acetyl CoA carboxylase (the key cc enzyme in lipolysis) and inhibiting acetyl CoA carboxylase (the key cnyme in lipolysis) and inhibiting acetyl CoA carboxylase (the key crown the full-length growth hormone fragment preferably contains cc enzyme in lipogenesis). The growth hormone gragment preferably contains cc entree the full-length growth hormone) and is optionally linked to an cc cont the full-length growth hormone) and is optionally linked to an cc epitope tag or heterologous fusion protein partner. The transgenic cc erganism may be a microorganism used to produce a fermented product organism may be a microorganism used to produce a fermented product cc eig., yeast), or an edible plant or animal or cell thereof. Food or cc eig., and may also be used to treat or prevent obesity, particularly cr in humans, and may also be used to improve the fat/lean ration of livestock raised for meat production. In the exemplification of the convention, the human growth hormone (hGH) fragment analogue AD9604 was in present sequence is described as a DNA sequence from yeast in the sequence listing, but is not further referred to in the
                                                                                                                                                                                                                                                    δÃ

The invention relates to isolated polynucleotide (I) and CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II) the CC constraints of the const

The nucleic acids are used to transform plants, and can produce soybean plants having an rhg1 or an Rhg4 SCN resistant allele. The nucleic acids can be used for investigating rhg1 or Rhg4 haplotypes of soybean plants and for introgressing SCN resistance or partial SCN resistance into soybean plants. They can also be used in plant breeding programmes. The invention also relates to proteins encoded by such

Human secreted proteins AAB75506 - AAB75554 are encoded by polynucleotide CC sequences AAF64176 - AAF64224. The specification includes amino acid CC sequences AAB75555 - AAB75606 which represent fragments of the human CC secreted proteins, and protein sequences with which they share homology. CC The proteins and polynucleotides, their agonists and antagonists have activities dependent on the tissues and cells in which they are care expressed, examples of these activities include, immunosuppressive; CC vasotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; CC virucide; fungicide, opthalmalogical; and vulnerary. The proteins, cc polynucleotides, agonists and antagonists can be used to treat or disgose various diseases and disorders including, autoimmune cc e.g. cardiac arrest, cerebrovascular disorders including, autoimmune cc e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, cc angiogenesis, neurous system disorders e.g. Alzheimer's disease, cc angiogenesis, neurous system disorders e.g. Alzheimer's disease, cardiavascular disorders e.g. cerebral ischaemia, cc e.g. corneal infection. The polypeptides can also be used to aid wound continue and poithelial cell proliferation, to prevent skin ageing due to content of primary tissues, to regenerate tissues and in chemotaxis. The colynucleotide sequences AAF64167 - AAF64175 and peptide AAB75505 which care used in the isolation, identification and characterisation of the proteins of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Email: est@watson.wustl.edu
Libraries were constructed by Dr. Stavros Bashiardes as part of the
Physcomitrella EST program (PEP) at the Univ. of Leeds (UK) and
Washington Univ. in St. Louis (USA) DNA sequencing by: Washington
University Genome Sequencing Center For information on obtaining a
clone please contact: Celia Knight (c.d.knight@leeds.ac.uk)
Seq primer: -40RP from Gibco
High quality sequence stop: 372.

                                                                                                                                                              130
                                                                                                                                                    synthesis, EcoRI adapters were ligated to the blunt ends and sample was digested with XhoI. The result is CDNA with an EcoRI sticky end on one side and a XhoI sticky end on the other. This cDNA was ligated directionally in UniZAP arms. The vector is designed containing the pBluescript sequence as well as lambda DNA and cDNA is cloned within this pBluescript sequence. The vector was then packaged using Gold gigapackaging extracts. Library was grown in XLIBlue MRF' cells and amplified. The library was grown in XLIBlue MRF' cells and amplified. The library was grown in XLIBlue MRF' cells and amplified that releases the pBluescript sequence and circularises that releases the pBluescript sequence and circularises it as single stranded plasmids that are then packaged (by helper phage) and secreted out of the host cell as phagemids. SOLR cells were transformed with phagemids and the library was plated out on LB-amp plates to select for transformants. Approximately 1,000,000 colonies were grown and recovered by using Quiagen Midi prep kit. 2 micro grams of each library were used to transform DH10B cells by electroporation."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note="Vector: pBluescript SK-; Site_1: EcoRI; Site_2: XhOI; Construction of the cDNA library was carried out using Strategenes 'Unizap - cDNA synthesis kit'. cDNA was constructed using an oligo dT primer/linker that contains a XhOI site within it. Following ds cDNA synthesis, EcoRI adapters were ligated to the blunt ends synthesis, EcoRI adapters were ligated to the blunt ends
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /clone_"PEP_SOURCE_ID:PPU090903"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A backbone of the vector is palluescript II, that was in vivo excised from a modified IPS phage vector (Mo bi Tec, Germany). XhoI digested: 5' end of cDNA is ligated to SalI site of the vector, and the BamHI digested: 5' end including poly-A tail is ligated to BamHI site of the vector. cDNA instert could be amplified with conventional T7 and T3 primers. This normarized full: length cDNA library was generated basically according to the method described in Genome Research 10, 1617-1630 (2000), Carninci, P. et al. Protonemata were blended by the POLYTRON, and then cultivated on the BCD medium containing lum NAA (naphthalene acetic acid) for 8 to 11 days under the continuous light.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A backbone of the vector is pBluescript II, that was in vivo excised from a modified IPS phage vector (Mo bi Tec, Germany). XhoI digested-5' end of cDNA is ligated to SalI site of the vector, and the BamHI digested-3' end including poly-A tail is ligated to BamHI site of the vector. cDNA instert could be amplified with conventional T7 and T3 primers. This normarized full- length cDNA library was generated basically according to the method described in Genome Research 10, 1617-1630 (2000), Carninci, P. et al. Protonemata were blended by the POLYTRON, and then cultivated on the BCD medium containing 0.51M BA (benzylaminopurine) for 8 to 13 days under the continuous light.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A backbone of the vector is pBluescript II, that was in vivo excised from a modified IPS phage vector (Mo bi Tec, Germany). XhoI digested-5 end of cDNA is ligated to Sall site of the vector, and the BamHI digested-3 end including poly-A tail is ligated to BamHI site of the vector. cDNA instert could be amplified with conventional T7 and T3 primers. This normarized full-length cDNA library was generated basically according to the method described in Genome Research 10, 1617-1630 (2000), Carninci, P. et al. Protonemata were blended by the POLYTRON, and then cultivated on the BCD medium containing 0.5uM BA (benzylaminopurine) for 8 to 13 days under the continuous light.
                                                                                                                                              Physcomitrella patens subsp. patens.

Physcomitrella patens subsp. patens

Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Bryopsida; Funariidae; Funariales; Funariaceae; Physcomitrella.

A backbone of the vector is phluescript II, that was in vivo excised from a modified IPS phage vector (Mo bi Tec, Germany). XhoI digested-5' end of cDNA is ligated to Sall site of the vector, and the BanHI digested-3' end including poly-A tail is ligated to BanHI conventional T7 and T3 primers. This normarized full-length cDNA library was generated basically according to the method described in Genome Research 10, 1617-1630 (2000), Carninci, P. et al. Protonemata were blended by the POLYTRON, and then cultivated on the BCD medium containing lum NAA (naphthalene acetic acid) for 8 to 11 days under the continuous light.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   National Institute of Genetics

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAGGCAAAAGGCAGAAATTG
Submitted (08-SEP-2000) Genoscope - Centre National de Sequencage, 2 rue Gaston Cremieux, CP 5706, 91057 EVRY cedex, FRANCE. (E-mail: segref@genoscope.cns.fr - Web : This GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces exiguus, Saccharomyces servazii, Zygosaccharomyces rouxii, Saccharomyces servazii, Zygosaccharomyces rouxii, Saccharomyces kluyveromyces thermotolerans, Kluyveromyces lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              57;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Genomic DNA isolated from broth cultures of E. histolytica using a method described by Clark and Diamond (Clark, C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a method for isolate identification. Exp. Parasitol. 77:450.). The DNA was mechanically sheared to give a tight size distribution (-2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."
